

AWS STUDENT BUILDER GROUP

AI-ASSISTED CLUB BLUEPRINT | PROPOSAL

LEARN • BUILD • CONNECT • GROW

A student-led ecosystem where cloud curiosity becomes practical capability.

LEARN	BUILD	CONNECT	GROW

Prepared as an AI-assisted planning document for a proposed campus AWS Student Builder Group. This blueprint is designed to be adapted to the college, available volunteers, faculty guidance, and official AWS program requirements.

Core idea: The club should be more than an event calendar. It should be a repeatable pathway that helps students move from learning cloud concepts to building, explaining, and showcasing real solutions.

01 | Purpose, Vision & Mission

Executive summary

The AWS Student Builder Group is proposed as a student-led learning community that makes cloud computing approachable, practical, collaborative, and career-relevant. It will combine short learning sessions, guided labs, project sprints, peer support, and showcases. Beginners should be able to join without prior AWS experience, while experienced members should have opportunities to mentor and lead.

VISION	MISSION	VALUES
Build a campus culture where students confidently use cloud technology to turn ideas into useful, demonstrable solutions.	Make learning accessible through hands-on practice, peer teaching, responsible experimentation, and a clear path from fundamentals to projects.	Curiosity • Inclusion • Practical learning • Collaboration • Integrity • Responsible technology use.

Why this club matters

- **Bridges theory and practice:** members practise concepts instead of only watching demonstrations.
- **Creates a safe starting point:** beginner tracks and peer support reduce the fear of asking questions.
- **Builds evidence of skills:** members leave with project notes, demos, and reflections they can discuss in interviews.
- **Strengthens the campus community:** students across years learn together and share opportunities.

Operating principles

Principle	How it appears in practice
Hands-on first	Every major learning session includes a lab, activity, or small deliverable.
Beginner-friendly	Explain prerequisites, provide starter resources, and avoid assuming prior cloud knowledge.
Small, consistent wins	Prefer regular progress and finished mini-projects over occasional large events with little follow-through.
Responsible building	Use approved accounts, protect credentials, watch costs, and follow institutional and AWS policies.

02 | Team Structure & Governance

Recommended structure

Keep the core team small enough to coordinate quickly, but distribute ownership so the club does not depend on one person. Roles can be combined if the founding team is small.

STUDENT BUILDER GROUP LEADER
Owns the vision, annual plan, partnerships, team coordination, and progress review.

WORKSTREAM	CORE RESPONSIBILITIES	EXAMPLE OUTPUT
Technical & Projects	Plan labs, guide cloud projects, review technical content, and support troubleshooting.	Lab guide, project demo, starter repository
Events & Operations	Manage schedule, venue/platform, run-of-show, registrations, and event feedback.	Event checklist, attendance, feedback summary
Marketing & Design	Create posters, social content, visual identity, and event promotions.	Promotion calendar, posters, recap posts
Communication & Community	Maintain announcements, welcome new members, answer common questions, and support peer groups.	Weekly update, onboarding guide, FAQ
Partnerships & Mentorship	Coordinate with faculty, alumni, speakers, and student mentors where available.	Speaker outreach, mentor matching, partner list

A simple accountability rhythm

WHEN	CHECK-IN	RESULT
Weekly	15-minute workstream update: done, next, blocked.	Clear owners and quick issue resolution.
Monthly	Review participation, activities, feedback, and spending/resources if applicable.	One-page progress summary and next-month plan.
Each term	Review goals with the faculty coordinator or relevant college authority.	Updated priorities and handover notes.

Leadership standard: assign one directly responsible owner to every activity, set a deadline, and close the loop with a short review. Invite volunteers to lead tasks rather than keeping all decisions with the leader.

03 | Activities & 12-Month Roadmap

Signature activity portfolio

ACTIVITY	FORMAT	STUDENT TAKEAWAY
Cloud Foundations	Beginner-friendly sessions and guided demos	Core vocabulary, cloud concepts, and confidence to start.
Build Nights	Small-group lab or project sprint	A working feature, deployment, or documented experiment.
Cloud Clinic	Drop-in troubleshooting and peer help	Help with blockers, setup, and learning questions.
Student Tech Talks	Short student-led talks and demos	Communication practice and knowledge sharing.
Project Showcase	Demo day with peer and faculty feedback	Portfolio evidence and constructive feedback.
Career & Certification Guidance	Resource sessions, study groups, alumni/industry talks where available	A clearer learning path and realistic next steps.

Roadmap: start small, then scale

PHASE	FOCUS	DELIVERABLES
1. Launch (Months 1–2)	Listen, recruit, orient, and establish the basics.	Introductory meetup, member survey, core team, community channels, first learning session.
2. Learn (Months 3–4)	Build a repeatable beginner learning rhythm.	Foundations sessions, guided labs, FAQs, first mini-project challenge.
3. Build (Months 5–8)	Help teams move from exercises to useful projects.	Project teams, mentor check-ins, build nights, mid-term demo review.
4. Showcase (Months 9–12)	Celebrate outcomes, reflect, and prepare the next cycle.	Showcase event, project portfolio, annual review, next-team handover.

Example monthly cadence

WEEK 1	WEEK 2	WEEK 3	WEEK 4
Learn a concept	Practise in a lab	Build in teams	Share progress + reflect

Cadence is a starting proposal, not a fixed rule. Adjust it around exams, college calendars, access to lab resources, and volunteer capacity.

04 | Member Experience & Community Growth

Member journey

1. DISCOVER	2. JOIN	3. PARTICIPATE	4. CONTRIBUTE	5. LEAD
See a demo, poster, or student story.	Attend an intro session and choose a beginner track.	Join a lab, group, or challenge.	Help a peer, share a demo, or volunteer.	Own a workstream, mentor a newcomer, or lead a project.

Ways to keep members engaged

- **Make the first step easy:** provide a clear welcome message, a short orientation, and a list of no-cost or approved learning resources.
- **Give members a reason to return:** make every session produce something useful, even if it is small.
- **Celebrate progress:** feature project demos, helpful contributions, learning milestones, and team effort—not only competition winners.
- **Support different experience levels:** offer beginner tasks alongside advanced project opportunities.
- **Close the feedback loop:** ask members what helped, what confused them, and what they want to learn next.

Marketing and communication plan

CHANNEL	PURPOSE	PRACTICAL APPROACH
Classroom & faculty networks	Reach students who may not follow tech pages.	Short announcement with a clear invitation and beginner-friendly promise.
WhatsApp / community channel	Keep members informed and reduce missed updates.	Post schedule, prerequisites, resources, and reminders in a consistent format.
Instagram / LinkedIn	Show activity and build credibility.	Share event recaps, student projects, learning tips, and member stories.
Peer ambassadors	Build trust across classes and branches.	Invite volunteers to explain the club and welcome new participants.

Inclusion and responsible practice

Keep participation welcoming regardless of prior experience. Do not require students to publish personal credentials or secrets. Use approved cloud accounts and lab environments, set budget alerts where relevant, and make sure members understand account security, privacy, copyright, and acceptable-use rules.

05 | Innovation, Measurement & Execution

Distinctive initiatives

INITIATIVE	HOW IT WORKS	WHY IT HELPS
3-Level Builder Path	Explorer learns the basics; Builder completes a project; Guide supports another learner.	Makes progress visible and creates a peer-mentoring culture.
One-Month Cloud Challenge	Teams solve a small, clearly scoped problem and show a working demo or prototype.	Encourages consistency, teamwork, and practical learning.
Student-to-Student Tech Talks	Members explain a tool, lesson, or project in short sessions.	Builds confidence and gives members ownership of the community.
Build Log / Project Wall	Record project goal, tools, key decisions, lessons, and demo link where permitted.	Creates a record of learning and helps future members build on past work.

Proposed success measures

Targets should be confirmed after the first month, once the team understands student interest and available resources. The figures below are illustrative planning targets—not official AWS requirements or promised results.

MEASURE	ILLUSTRATIVE YEAR-ONE TARGET	HOW TO TRACK
Active participation	Build a consistent core community; set a target after recruitment.	Attendance plus repeat participation, not registrations alone.
Learning activities	1–2 meaningful activities per month during active periods.	Activity calendar and completion notes.
Projects	At least 4 documented mini-projects or prototypes if capacity allows.	Project log, demo, repository or report where appropriate.
Member experience	Review feedback after each major activity.	Short survey and one or two improvement actions.
Leadership pipeline	Give multiple members a chance to own a task or session.	Owner list, handover notes, and volunteer reflections.

Risks and mitigation

RISK	RESPONSE
Low or inconsistent attendance	Ask students what they need, use short formats, publish dates early, and share useful recaps.
Overloaded volunteers	Keep activities achievable, rotate ownership, and maintain a backup owner for critical tasks.
Cost or account issues	Prefer approved learning environments, free resources where suitable, and clear account/budget safeguards.
Activities without outcomes	Define a small deliverable before each session and review it afterwards.

Closing statement

The proposed AWS Student Builder Group is built around a simple promise: students should not only hear about cloud technology—they should have a supportive place to practise it, build with it, and teach others what they learn. With a clear team structure, consistent hands-on activities, inclusive community practices, and honest measurement, the club can grow sustainably and create meaningful value for the campus.

FROM CAMPUS CURIOSITY TO CLOUD CAPABILITY.

Note: This is an AI-assisted proposal. Adapt the plan to the college’s policies, faculty guidance, available resources, and the current requirements of any official AWS student program before implementation.
