MY CLUB BLUEPRINT

AWS STUDENT BUILDER GROUP | MANUAL DOCUMENT

PREPARED BY

Name : SUHAS T K

College : Don Bosco Institute Of Technology

Department : CSE

My one-sentence goal for the club: My goal is to build a student-driven AWS community where learners turn their ideas into practical cloud solutions, support one another, and grow into confident innovators and leaders**.**

01 My Vision & Motivation

- **WHY I WANT TO HELP LEAD THIS CLUB:** I want to help lead this club because learning AWS should involve more than watching videos. I want students like me to get opportunities to practise what we learn, try small projects, make mistakes, and understand how cloud technology works in real situations . As a CSE student, I know it can be difficult to decide where to start when a technology has many new tools, and setup steps
- **THE PROBLEM I WOULD LIKE US TO SOLVE** Students can find cloud resources online, but choosing a sensible learning path and turning it into a small working result can be confusing. Some hesitate because they worry about making

mistakes, account security, or unexpected charges. Others understand a concept during a demonstration but do not get enough time to apply it.

- **MY VISION :** A campus where students are comfortable asking “Could we build a simple solution for this?”—and know how to test that idea responsibly with technology.
- **MY MISSION:** WHAT I WOULD ACTUALLY DO

  · Before choosing our first project, I would ask students and faculty what problems they face on campus. We could collect their suggestions through a short Google Form or an informal discussion and select one problem that a beginner team could realistically work on

  · Break unfamiliar cloud topics into short sessions with one clear outcome and beginner-friendly instructions.

  · Create mixed-experience teams so students practise explaining, listening, and troubleshooting together.

  · Ask each project team to document what worked, what failed, and what it would change next time.

  · Promote secure and cost-aware experimentation using only approved accounts, environments, and resources.

02 My Team Structure & Leadership

ROLE / TEAM	MAIN RESPONSIBILITY	HOW I WOULD SUPPORT THEM
Club Leader	Keep the plan aligned, coordinate the team, and review progress.	Set priorities with the team, ask for blockers early, and share decisions transparently.
Technical & Projects	Choose suitable learning tasks, prepare demos, and guide project work.	Give them preparation time and encourage peer review before a session.
Events & Operations	Arrange the venue or online room, schedule, registration, and event flow.	Use checklists and a backup plan so no one person carries every detail.
Marketing & Design	Explain why an activity is useful and create clear, accessible promotions.	Share dates and information early; allow creative ownership within a common style.
Communication & Community	Welcome members, publish updates, and collect questions and feedback.	Give them a consistent message format and authority to answer routine questions.
Mentorship / Partnerships	Coordinate peer mentors and contact faculty, alumni, or speakers when appropriate.	Provide a short introduction template and agree on responsibilities before outreach.

- **HOW I WOULD DELEGATE TASKS AND DEADLINES** :I would describe each task using four fields: the outcome we need, the person responsible, the due date, and the support available. Instead of saying “please handle promotion,” I would ask for a poster draft by a named date, provide the event details, and agree who will review it. I would check progress early enough to help—not wait until the deadline to discover a problem.

- **HOW I WOULD COMMUNICATE** : I would keep one official channel for announcements and one shared task board or spreadsheet for owners and deadlines. A short weekly check-in would cover three questions: What moved forward? What is next? What is blocked? Important decisions would be written down with an owner so absent members can catch up without relying on rumours or private messages.
- **HOW I WOULD RECOGNIZE CONTRIBUTIONS AND BUILD NEW LEADERS** :Recognition should include quiet but important work: helping a beginner, fixing an instruction, testing a demo, or keeping an event organized. I would thank people specifically, rotate visible responsibilities, and let a member shadow an activity lead before owning one. After an event, a short reflection would focus on what to repeat and what to improve—not blame.

03 My Signature Ideas

IDEA 1 — BUDDY BUILDER: LEARN IN PAIRS, NOT IN SILENCE

I would invite members to sign up with a topic they want to understand and the times they are normally available. Pairs would be matched around compatible goals and schedules, not simply by year. The pair would choose one small learning task, meet briefly each week for three weeks, and record one thing understood, one obstacle, and the next step. The person with more experience is a peer partner—not an unpaid lecturer—and both members should explain something during the cycle. If the match does not work, members can request a new pairing without embarrassment.

IDEA 2 — MONTHLY "CAMPUS FIX" PROTOTYPE SPRINT

Instead of selecting a random technology first, teams would begin with a simple problem students recognize. Possible examples are a page that lists student club resources, a small event discovery prototype, or a searchable index of public learning links. Teams would keep the first version narrow: describe the user, sketch the flow, create a prototype, test it with a few volunteers, and explain what is still missing.For our first Campus Fix sprint, I would keep the project small. For example, we could build a simple webpage that helps students find useful college resources. We would test it with a few students, collect their feedback, and improve it before considering anything bigger.

04 Roadmap, Activities & Recruitment

PHASE	MY PRIORITY	ACTIVITY / DELIVERABLE	HOW I WOULD CHECK PROGRESS
Months 1–2 / Listen & set up	Learn what students need and establish basic routines.	Collect problem ideas; form a core team;	A short needs summary, named role owners,
Months 3–4 / First experiments	Make the first practical sessions approachable	Run a beginner session and a small prototype activity; collect feedback	Can attendees explain what they tried and where they need support next?
Months 5–8 / Campus problems	Move from isolated demos to team problem-solving	Run the Cloud Problem Postbox and scoped Campus Fix sprints.	Record prototypes, feedback, lessons, and decisions about next steps

HOW I WOULD HELP BEGINNERS RETURN

I would give newcomers a short “start here” note with a glossary, next activity date, and one easy first task. Prerequisites would be stated honestly, and participation would not depend on paid tools or an existing AWS account. Each session should end with a useful result or clear next step. I would ask first-time participants what felt confusing and use their feedback to improve the next session

05 Challenges & My Response

POSSIBLE CHALLENGE	MY PRACTICAL RESPONSE	WHO CAN HELP
Low attendance	Ask a few students what made participation difficult; adjust timing, shorten the activity, and make the outcome clearer. Share a useful recap for those who cannot attend.	Community lead, class representatives, faculty coordinator
Team members become	Check in privately and	Workstream owner and club

inactive	respectfully. Ask whether the issue is time, confidence, or unclear tasks; reduce or reassign work by agreement. Avoid public blame	leader
A disagreement in the team	Let each person explain their reasoning. Compare choices against agreed criteria— learning value, feasibility, time, access, and safety. Record the decision and review it after trying	Club leader; faculty coordinator if needed
Students feel technical work is too hard	Split tasks into smaller steps, explain terms plainly, provide a starter example, and let members ask for help without being judged.	Technical volunteers and peer buddies

HOW I WOULD RESOLVE A DISAGREEMENT FAIRLY

First, I would pause the conversation if it became personal and bring it back to the shared outcome. Each person would get a chance to state their concern without interruption. I would summarize the points of agreement and disagreement so nobody feels ignored. If the decision affects college rules, student privacy, or spending, I would ask the appropriate faculty member rather than decide beyond my authority. I would document the outcome and check whether it worked.

HOW I WOULD KEEP ACTIVITIES ACHIEVABLE AROUND EXAMS

I would check the college calendar before committing to large activities. During exam weeks, the club could pause major events and keep only optional, self-paced tasks or resource sharing. I would set a minimum useful version for every activity, assign a backup owner for important tasks, and avoid promising a schedule that depends on one person being available every day. It is better to deliver one well-run small session than several rushed events

06 Success Measures & Personal Commitment

AREA	WHAT I WOULD TRACK	FIRST-YEAR STARTING TARGET
Participation	How many people return and contribute, not only how many register.	Set the baseline after the first two activities; aim to retain a steady core group.
Learning	Whether members can explain a concept and complete a guided task.	Keep a simple activity log and ask each participant for one takeaway
Projects	Prototypes, diagrams, user feedback, and short project notes	Aim for 3 small documented prototypes if time and resources allow
Community	Peer support, newcomer comfort, and feedback after activities.	Ask for a one-minute feedback check after each major session and act on it
Leadership	Members who own tasks, host a demo, or help a newcomer.	Give several members a chance to lead a small responsibility during the year.

WHAT I WILL PERSONALLY COMMIT TO

> Be dependable: share updates early if I am blocked, and do not hide delays until the deadline.

> Listen before deciding: collect feedback from beginners as well as experienced members

> Learn in public: admit when I do not know an answer and find a reliable way to check it

> Protect trust: treat members respectfully and follow agreed security, privacy, and permission rules.

> Make leadership transferable: document event routines and give other students real chances to lead.

MY CLOSING MESSAGE TO THE SELECTION TEAM

My approach is to let students help choose the problems the club works on, then give them a practical route to test an idea with support. I would start by listening, agree on a small number of achievable commitments, and build trust by following through.If I get the opportunity to lead this club, I want students to leave each activity having learned something useful. I would like to start with small AWS sessions and student projects, learn

from the feedback we receive, and gradually involve more students in organizing activities. My aim is to build a club where even beginners feel comfortable asking questions and trying their own ideas .
